

# Design and analysis methods for privacy technologies

PUBLIC DEFENSE

**Carmela Troncoso**

Advisors: Prof. Bart Preneel and Prof. Claudia Diaz

Jury members:	Prof. Ann Haegemans	Prof. Frank Piessens
	Prof. Adhemar Bultheel	Prof. Nikita Borisov
	Prof. Geert Deconinck	Dr. George Danezis

# Privacy is a very valuable asset

---

New technologies make our life easier and more comfortable

and we would like to enjoy technological advances while maintaining similar privacy guarantees as in the offline world

How can we ensure that systems actually protect privacy?

**Design** and **analysis** methods for privacy technologies

How can we build systems that integrate privacy protection?

# “offline world” vs “online world”

---

face-to-face

Learning your shopping profile

Papers in physical archives

- ▶ Easy/cheap to collect, store search, and process
- ▶ Easy to aggregate, make profiles and inferences
- ▶ Easy to copy/disseminate, but hard to destroy
- ▶ Information never forgotten

# Privacy-preserving solutions

---

- ▶ Trust organizations to protect data
  - ▶ Trust assumptions may not be realistic
    - ▶ accidental leakages or malicious insiders
    - ▶ malicious outsiders exploiting vulnerabilities
    - ▶ incentives to misuse information
  - ▶ Weak enforcement, low penalties
- ▶ Design technology to provide assurances where possible
  - ▶ Privacy Enhancing Technologies

# Privacy Enhancing Technologies

---

- ▶ **Anonymous credentials**
  - ▶ Prove an attribute meets a given condition without revealing its value
- ▶ **Private Information Retrieval**
  - ▶ Access to a database without revealing which entry has been queried
- ▶ **Differential privacy**
  - ▶ Extract statistical information from a database without revealing data about individual entries
- ▶ **Anonymous communications, location privacy mechanisms,...**

# The challenge

---

- ▶ How to design privacy systems
  - ▶ Compositionality of privacy technologies
  - ▶ Privacy-by-design methods
- ▶ How to analyze privacy systems
  - ▶ Current analysis techniques too ad-hoc
  - ▶ General analysis methods
- ▶ The lack of general methodologies hinders
  - ▶ The validation and comparison of systems
  - ▶ The development of robust PETs

# Thesis outline

---

**Goal:** *provide tools and guiding principles  
for the analysis and design of privacy-preserving systems*

- ▶ **PART I: ANALYSIS OF PRIVACY-PRESERVING SYSTEMS**
  - ▶ Chapter 2: Traffic analysis in anonymous communications
  - ▶ Chapter 3: Perfect matching disclosure attacks
  - ▶ Chapter 4: Bayesian inference to de-anonymize persistent communications
  - ▶ Chapter 5: A Bayesian framework for the analysis of anonymous communication systems
  
- ▶ **PART II: DESIGN OF PRIVACY-PRESERVING SYSTEMS**
  - ▶ Chapter 6: Location privacy: an overview
  - ▶ Chapter 7: Privacy-friendly pay-as-you-drive applications

---

# PART I: ANALYSIS OF PRIVACY-PRESERVING SYSTEMS

# Anonymous communications

---

- ▶ Content protection is not enough, traffic data encodes information
  - ▶ Communication profiles

## Anonymous Communications

Conceals who speaks with whom  
Modifies traffic data

**vs**

## Traffic Analysis

Uncover who speak with whom  
Exploits traffic data

# Mix networks

- ▶ Mixes hide relations between inputs and outputs
- ▶ Mixes are combined in networks in order to
  - ▶ Distribute trust (one good mix is enough)
  - ▶ Load balancing (no mix is big enough)

# Perfect Matching Disclosure Attacks<sup>[1]</sup>

- ▶ Persistent communication partners can be uncovered observing the system long enough (de-anonymization and profiling) [Dan03, DS04, AK03, ...]
- ▶ Key observation:
  - ▶ Considering all senders and receivers simultaneously yields better results

- ▶ Contributions
  - ▶ PMDA: attack based on finding maximum weighted perfect matchings
  - ▶ NSDA: attack based on normalizing matrixes to take into account interdependencies amongst sender profiles
  - ▶ Enhanced profiling technique re-using information

# Bayesian inference to de-anonymize persistent communications<sup>[2]</sup>

- ▶ PMDA: two disadvantages
  - ▶ Computationally bounded
  - ▶ Straightforward reuse of information biases the result
- ▶ Key contributions
  - ▶ Vida model: General model to abstract any anonymity system
  - ▶ Bayesian techniques to co-estimate profiles and de-anonymize messages
    - ▶ Optimal reuse of information
    - ▶ Sampling to reduce computation requirements
- ▶ Redefining the traffic analysis problem: given an observation find “hidden state” of an anonymity system

We know how to compute this

$$\Pr(HS | O, C) = \frac{\Pr(O | HS, C) \cdot \Pr(HS | C)}{\sum_{HS} \Pr(HS, O | C)}$$

Too large to enumerate!!

$$HS_1, HS_2, HS_3, \dots \sim \Pr(HS | O, C)$$

Markov Chain Monte Carlo Methods – Gibbs sampler

# A Bayesian framework for the analysis of anonymous communication systems <sup>[3]</sup>

---

- ▶ In the past the analysis of anonymous communication systems
  - ▶ Based on heuristics and specific models, not generic
  - ▶ Systems are evaluated against one attack at a time
    - ▶ Network constraints [Dan03]
    - ▶ Users knowledge [DanSyv08]
    - ▶ Persistent communications [Dan03, DS04, AK03, ...]
    - ▶ ...
  - ▶ Simplified models
    - ▶ Exact calculation of probability distributions in complex systems was considered as an intractable problem [Serjantov02]

# Mix networks and traffic analysis

- ▶ Determine probability distributions input-output

- ▶ Threshold mix: collect  $t$  messages, and outputs them changing their appearance and in a random order

# Mix networks and traffic analysis

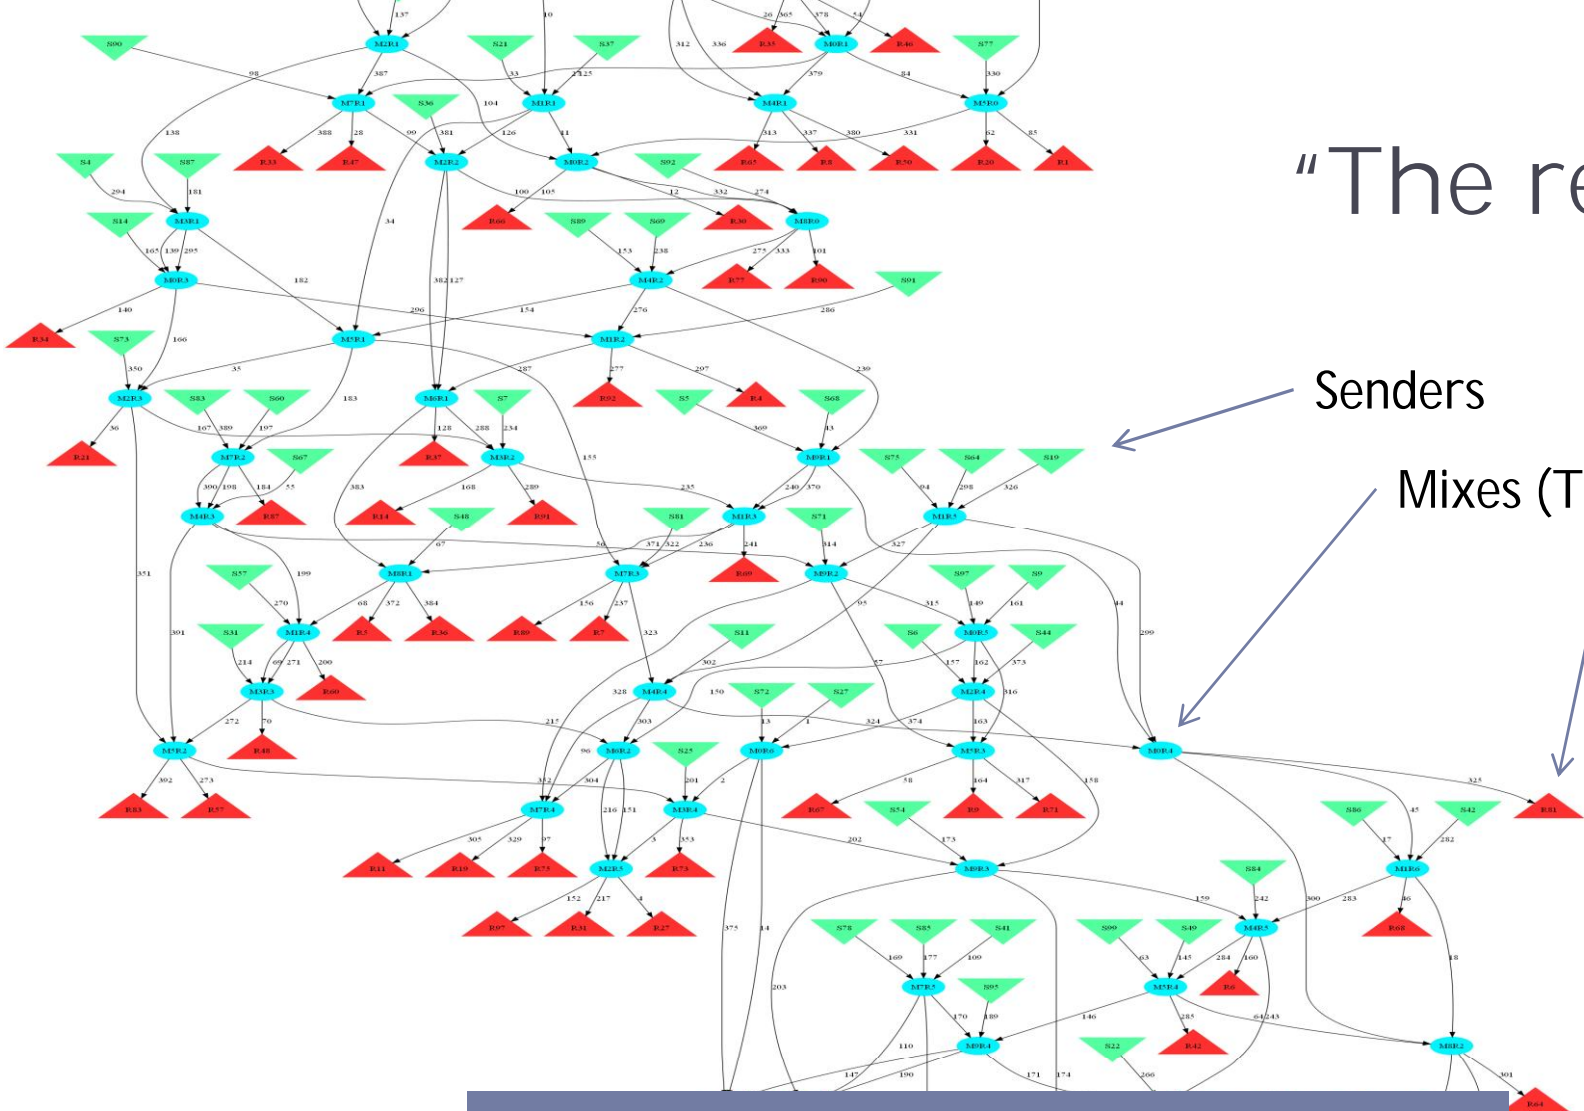

- ▶ Constraints, e.g. length=2

**Non trivial given observation!!**

“The real thing”

Senders

Mixes (Threshold = 3)

Receivers

**Is there a method to compute these probabilities systematically??**

# Sampling to estimate probabilities

---

- ▶ Recall: we reduce the traffic analysis problem to computing
$$\Pr( HS \mid O, C )$$
  - ▶ infeasible to compute analytically because there are too many HS
  - ▶ ... but we only care about marginal distributions
    - ▶ Is Alice speaking to Bob?  $\Pr( A \rightarrow B \mid O, C )$
- ▶ We can calculate those if we have many samples of HS according to  $\Pr( HS \mid O, C )$ 
  - ▶ We can simply count how many times Alice speaks to Bob
- ▶ Markov Chain Monte Carlo methods
  - ▶ Sample from a distribution difficult to sample from directly

# Metropolis Hastings Algorithm

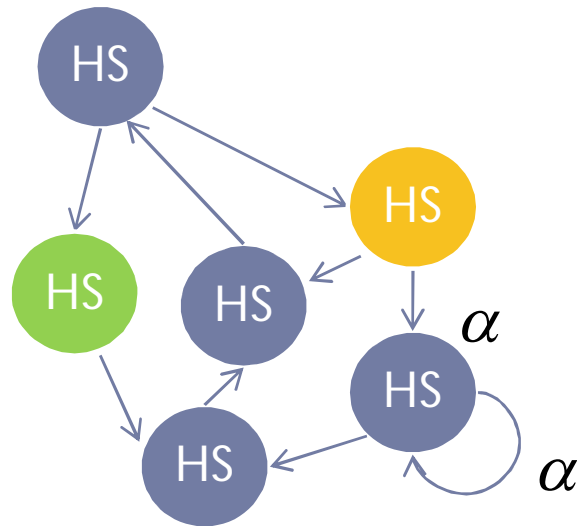

- Constructs a Markov Chain with stationary distribution  $\Pr(HS | O, C)$

$$\alpha = \frac{\Pr(HS_{candidate})Q(HS_{candidate} | HS_{current})}{\Pr(HS_{current})Q(HS_{current} | HS_{candidate})}$$

$\alpha \geq 1$  **Go!**

$\alpha < 1$  **Go with probability  $\alpha$**

- Our transition results in dependant states
- Repeat this basic step to get independent samples of HS

# Applications

---

- ▶ Evaluation information theoretic metrics for anonymity

$$H = - \sum_{R_i} P(A \rightarrow R_i | O, C) \cdot \log P(A \rightarrow R_i | O, C)$$

- ▶ e.g., comparison of network topologies <sup>[3]</sup>
- ▶ Estimating probability of arbitrary events
  - ▶ Input message to output message?
  - ▶ Alice speaking to Bob ever?
  - ▶ Two messages having the same sender?
- ▶ Accommodate new constraints
  - ▶ Key to evaluate new mix network proposals

---

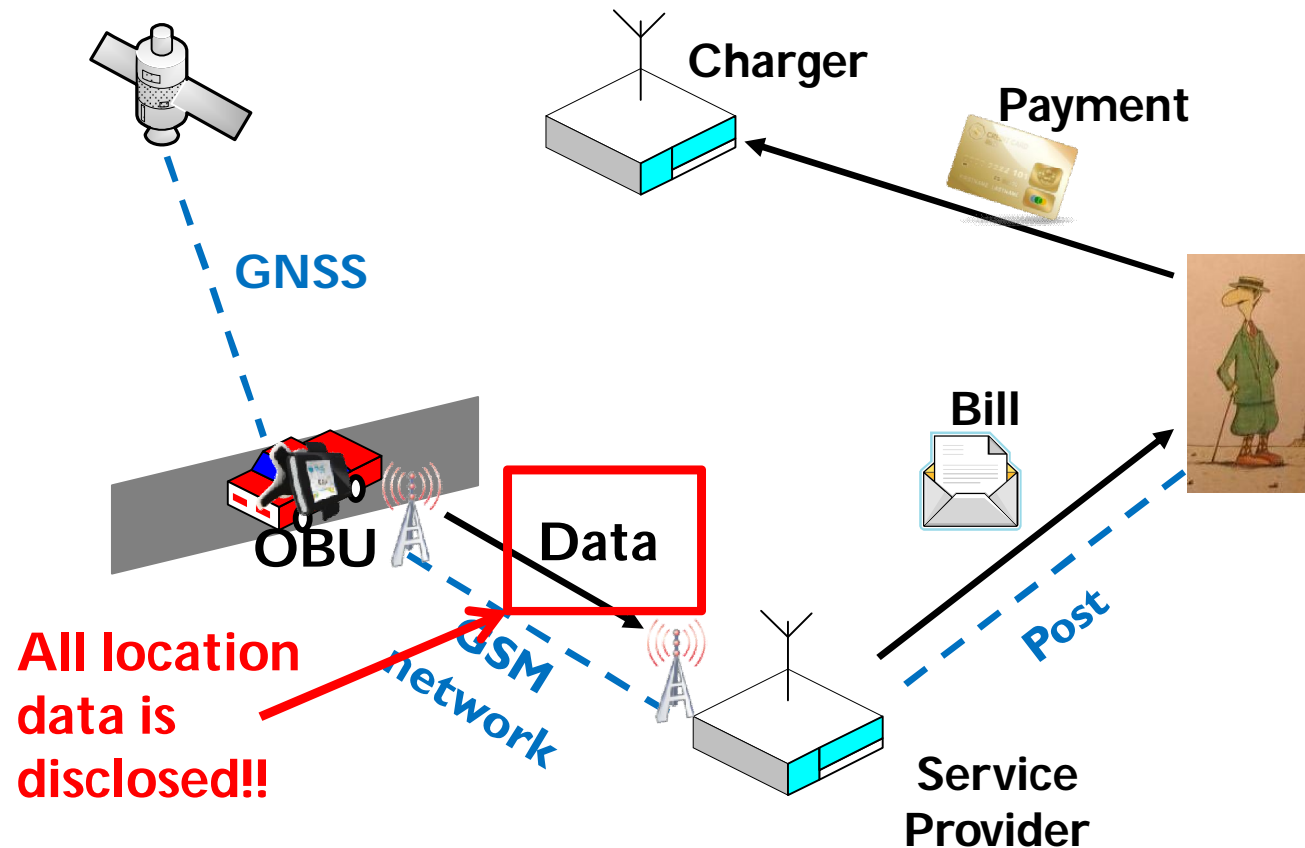

# PART II: DESIGN OF PRIVACY-PRESERVING SYSTEMS

# Pay-as-you-drive applications

---

- ▶ Pay-As-You-Drive: the concept
  - ▶ Concept:
    - ▶ Users should pay depending on their use of the car and roads:
      - Long drives, high density roads, rush hours: higher fee
      - Sporadic use, second vehicle for weekends, young drivers with small salary: smaller fee
  - ▶ Applications
    - ▶ Road pricing (ETP) – Mandatory in the EU within 3 years
    - ▶ Vehicle insurance (PAYD)

# Straightforward implementations

- ▶ Location data is highly sensitive
- ▶ Trust organization for privacy protection
- ▶ Third parties involved

# Our contribution

---

- ▶ Two architectures for PAYD systems that fulfill privacy and security requirements
  - ▶ PriPAYD [4,5]
    - ▶ Key idea: processing of sensitive data local to the user
  - ▶ PrETP [6]
    - ▶ Advanced cryptography to fulfill security requirements
  - ▶ Holistic analysis
  - ▶ Ready to deploy in the real world
- ▶ Identification of design principles that lead to systems that offer strong privacy guarantees to their users

▶ 24 [5] PriPAYD: Privacy Friendly Pay-As-You-Drive Insurance, C. Troncoso, G. Danezis, E.Kosta, J. Balasch and B. Preneel. TDSC 2011

[6] PrETP: Privacy-preserving Electronic Toll Pricing J. Balasch, A. Rial, C. Troncoso, C. Geuens, B. Preneel, and I. Verbauwhede. Usenix Security 2010

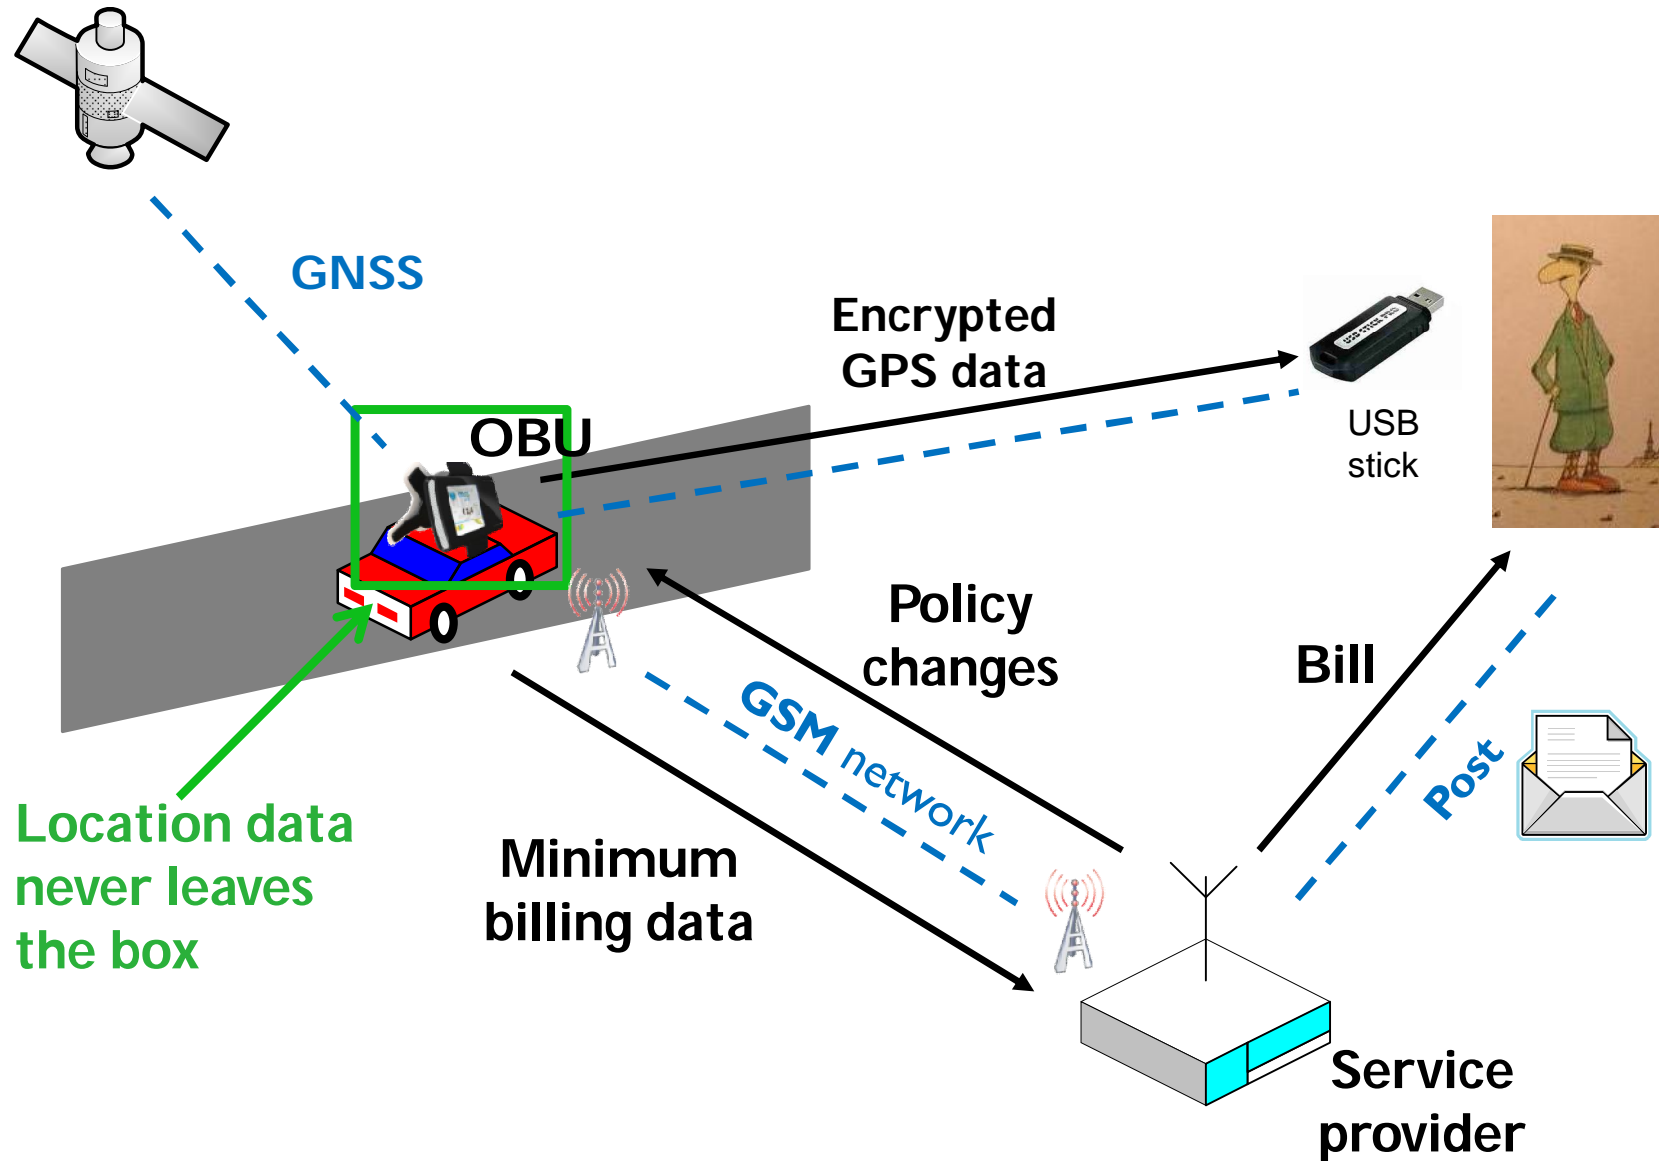

# Privacy-preserving Pay-as-you-drive

---

- ▶ Privacy issues?
  - ▶ *Pay as you drive*
  - ▶ Fine grained GPS data allows for inferences
- ▶ What data is necessary?
  - ▶ Final fee that the user must pay to the provider/government
    - ▶ No need to collect everyone's detailed location data
- ▶ Legal / service integrity issues
  - ▶ Actors must not be able to cheat
  - ▶ Actors must be held liable when misusing the system

# Local processing of location data

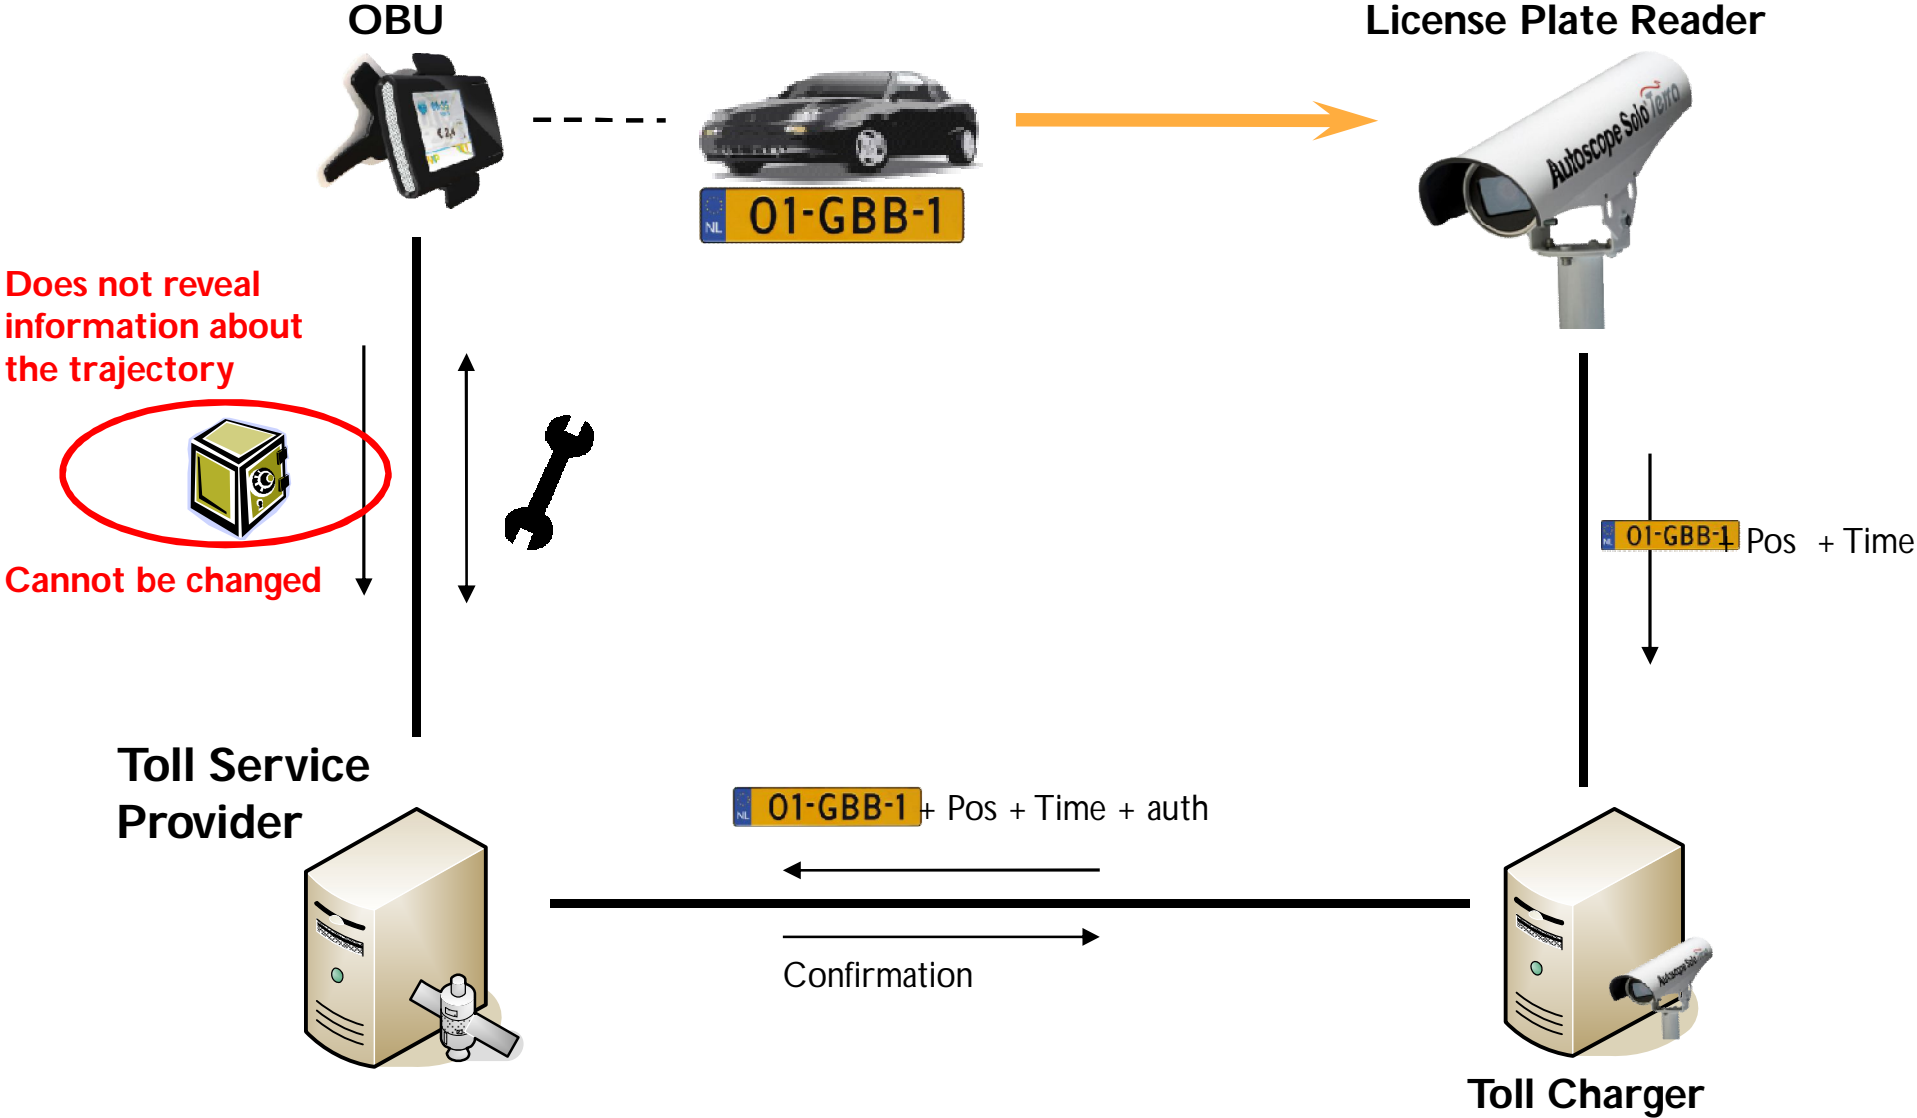

# Service integrity

---

- ▶ OBU in hands of the user
  - ▶ Incentives to lower the premium
- ▶ Fraud-detection should include:
  - ▶ vehicles with inactive OBUs
  - ▶ vehicles reporting false location data
  - ▶ vehicles using incorrect road prices
  - ▶ vehicles reporting false final fees
- ▶ Random spot checks to detect cheating

# How does it work?

# What can we prove?

---

- ▶ OBU was active
  - ▶ A commitment with the committed location must be available
- ▶ OBU used correct prices
  - ▶ Prices in the table signed by Toll Service Provider
  - ▶ Check correct pricing upon commitment opening
- ▶ OBU was at reported location
  - ▶ Compare photo location with committed location
- ▶ OBU made correct operations
  - ▶ Homomorphic commitments: prices in the “vaults” can be added to verify that they correspond to the reported final fee without being opened

# Lessons learned

---

- ▶ In order to obtain strong privacy guarantees
  - ▶ The goal of the system must be well defined and feasible
  - ▶ Identify the minimal set of data needed for fulfilling this goal
  - ▶ Identify and model potential adversaries, multilateral security analysis
  
- ▶ Implement a solution that fulfills the requirements while revealing the minimal amount of private data

# Conclusions

---

*“Part of what makes a society a good place in which to live is the extent to which it allows people freedom from the intrusiveness of others. A society without privacy protection would be suffocation.”*  
(Solove)

- ▶ Our actions and interactions are increasingly mediated by technology
- ▶ We leave digital traces everywhere

***We need robust privacy-preserving technologies***

---

# Conclusions

---

- ▶ The analysis of privacy-preserving systems
  - ▶ Method to uncover relationships that takes into account all users simultaneously
  - ▶ Bayesian inference and Markov Chain Monte Carlo methods for traffic analysis
    - ▶ Systematic approach
    - ▶ Answers arbitrary questions about the entities in the system
    - ▶ Sampling reduces computational requirements
- ▶ The design of privacy-preserving systems
  - ▶ Two systems for privacy-preserving pay-as-you-drive applications
    - ▶ Local processing of sensitive data
    - ▶ Advanced privacy-preserving cryptographic primitives for security
    - ▶ Reduced risk and cost

# Future work

---

- ▶ The analysis of privacy-preserving systems
  - ▶ Extend the Bayesian methods to other fields location privacy, social networks,...
  - ▶ Automate the modeling and analysis
- ▶ The design of privacy-preserving systems
  - ▶ More use cases to refine the principles
  - ▶ Full-fledged methodology

# Publication list

---

- ▶ 22 publications
  - ▶ 2 international journals
  - ▶ 6 Privacy Enhancing Technologies Symposium
  - ▶ 4 ACM Workshop on Privacy in the Electronic Society
  - ▶ 2 USENIX Security Symposium
  - ▶ 2 European Symposium on Research in Computer Security
  - ▶ 1 ACM Conference on Computer and Communications Security
  - ▶ 5 other international conferences and workshops
